

Router Tests V.3

Scott Bradner

Harvard University

Copyright © 1990 by Scott Bradner. This report may be freely reproduced as long as nothing is altered or removed. These results are accurate to the best of my knowledge although there might be typographical or transcribing errors. The vendor information was supplied by vendor representatives and I make no claims as to its accuracy.

Testing the Devices

Just how does one find out
what is real?

PTA

- Performance Testing Alliance
- vendor & user group
 - device testing
 - adapter testing
 - software testing

Test Design-1

Test Design-3

BMWG

Benchmarking Methodology Working Group

- Part of IETF
 - Internet Engineering Task Force
- Sanctioned by IAB
 - Internet Activities Board
- Addressing:
 - 1 - define terms
 - throughput
 - latency
 - etc
 - 2 - define device classes
 - stand alone
 - bridges
 - routers
 - gateways
 - host dependent
 - network interfaces
 - software
 - 3 - define specific tests
 - 4 - define reporting terminology
- Mailing list
bmwg-request@harvisr.harvard.edu

Test Design-2

Life on a real world network:

Pathological conditions:

Peak load

- arp storms
- broadcast storms
- rwho on diskless nodes
- bootp
- tftp booting

Back-to-back packets

- NFS traffic
- routing updates

Test Design-4

Life on a real world network:

"Normal" conditions

- NFS servers
- named
- NNTP
- SMTP
- PC clusters
- FTP
- terminal servers

Test Design-5

Potential zaps

Network management

- standards
SNMP, CMOT
- proprietary

Documentation

- Fit for human consumption?

User interface

- How expensive a guru is needed?

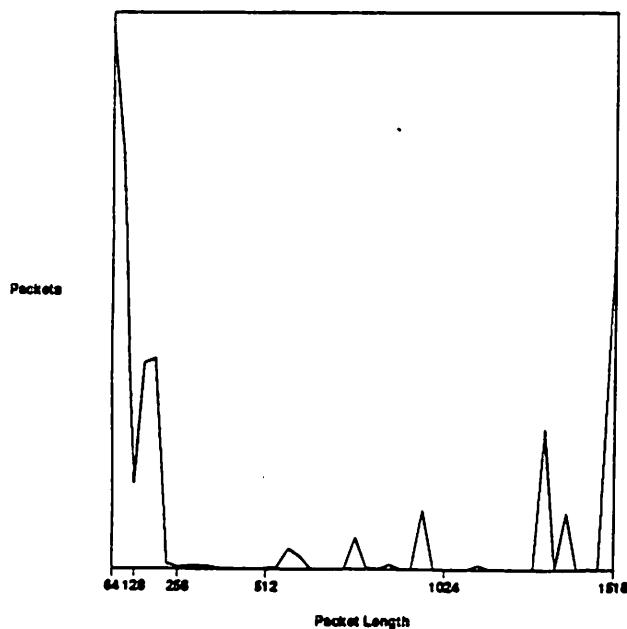

Reachability

- Can it be managed over the network?
- How easy is it to crash the router so that it requires manual intervention?
- How easy is it to overload the router so that the processor does not respond to commands on the serial line?

Test Design-7

Life on a real world network:

Packet length distribution on Harvard subnet

Test Design-6

Life on a real world network:

Security

- What access controls on router?
- What sorts of filtering can be done on traffic?
 - On source of traffic
 - On destination of traffic
 - On protocol type?

Test Design-8

Testing, how to simulate real world

- Can't do a very good job of simulating the "real world"
- Easy to check simple things
 - Idle state
 - Delay through router
 - Effects of various filtering options
 - Accuracy of counters
 - Reaction to error packets
 - Effect of different protocols
- Not too hard to simulate the pathological conditions
 - High offered load
 - Back to back packets
- Much harder to test for table space related limits
 - Routing table size
 - Arp cache size
 - Filtering list space

We put together a setup that would do some of the easy tests, and punted on the harder ones

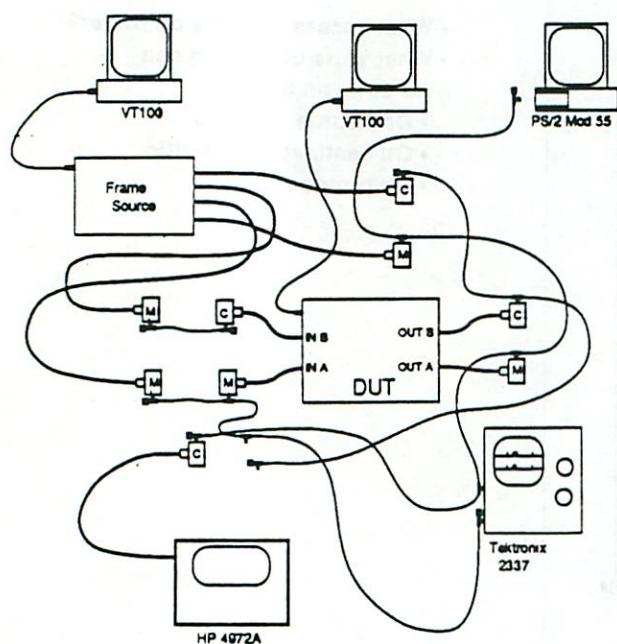

Traffic generator

- built by Terry Bradley of Wellfleet Communications
- based on the Wellfleet platform (LN & CN)
- includes controls for protocol type, packet size, speed (from 1 to 14,500 packets per second), and count (1 to 10,000,000)
- designed to be able to implement some of the BMWG tests

Test Design-9

Test Design-11

Test set up

Test Design-10

Terry

Terry was one of nine founding engineers at Wellfleet and has contributed to the Architecture of the Bridge/Router, developed the lower layer protocols in the product and was one of the pioneer implementors of SNMP.

Terry is currently managing Wide-Area protocol development and also runs the QA group at Wellfleet.

Prior to Wellfleet, Terry worked for AT&T Bell Labs and Logica UK.

Test Design-12

Packet source

- Wellfleet router with special software

- command line:

```
source slot count protocol ifg length
```

slot:

3 = Source A

4 = Source B

count: number of packets to transmit

protocol: Slot 3

0. AppleTalk Phase 1

1. Novell IPX

2. DECnet 1.1 -> 1.3

3. UDP/IP 192.32.100.1 -> 192.32.200.1

4. Bridgeable Protocol 0900 (UB net debug)

5. AppleTalk Phase 2

protocol: Slot 4

3. UDP/IP 192.32.101.1 -> 192.32.201.1

4. Bridgeable Protocol 0900 (UB net debug)

ifg: wait loop count between frames

length: frame length (w/o CRC)

Source data rate

- on Ethernet

size	theor	slot 3	slot 4
64	14880	14489	14549
128	8445	8324	8340
256	4528	4494	4498
512	2349	2340	2341
1024	1197	1195	1195
1518	812	812	812

Test Design-13

Test Design-15

Start command

- separate command to start the frame stream

```
e 31.slot.4.1 [ 31.slot.4.1 ]
```

- two data streams will be started if the e command has two arguments

Keep Alive source

- many protocols require "keep alive" traffic

- slots 2 & 5 of the modified router can produce "keep alives"

- support for:

ARP

AppleTalk I

AppleTalk II

DECNET

IPX

bridge

Test Design-14

Test Design-16

<p>Device configuration</p> <ul style="list-style-type: none"> • device to be tested is configured at the start of the tests • all of the protocols to be tested are configured • configuration kept the same until filtering tests • filters added without changing any other setup • bridging test configured & run separately 	<p>Procedure: raw rate</p> <ul style="list-style-type: none"> • HP 4972A lan analyzer connected to the router output • HP analyzer running the stats program • send about 20 sec worth of frames at min ifg • reset stats after the start of the frame stream • watch the "10 sec avg" to get the output rate
<p>Test Design-17</p> <p>Procedure: delay</p> <ul style="list-style-type: none"> • send 2000 frames of IP traffic with a ifg of "5000" • using the scope, measure the time between the end of the input frame and the beginning of the output frame 	<p>Test Design-19</p> <p>Procedure: max rate</p> <ul style="list-style-type: none"> • HP 4972A lan analyzer connected to the router output • HP analyzer running the stats program • reset stats • send 20 to 30 sec worth of frames through device with a specific ifg • after all frames have been sent, look at the "total frames" count on the HP. If received count is less than sent, increase the ifg and try again If received count is the same as sent (+ any keep alives) reduce the ifg and try again • the "max rate" is the point at which if the ifg is reduced by 1 the full count of frames will not get passed • after getting the ifg value, reconnect the HP to the packet source and rerun the frame stream. use the HP "10 sec avg" to determine the "max rate"

Procedure: dual stream

- HP 4972A lan analyzer connected to the first of the router outputs
- HP analyzer running the stats program
- set both the slot 3 and slot 4 generators up:
with a "0" ifg
using IP
with the same frame count and size
- start both slot 3 and 4 with a single e command
- reset stats
- use the "10 sec avg" to determine the rate
- reconnect the HP to the other output
- rerun test to get 2nd rate

Test Design-21

Test Frames

- IP frame
192.32.100.1->192.32.200.1

```
ip2_frame[60] = {
    0xAA, 0x00, 0x04, 0x00, 0x02, 0x04,
    0xAA, 0x00, 0x04, 0x00, 0x01, 0x04,
    0x08, /* type field hiby */
    0x00, /* type field loby */
    0x45, 0x00, 0x00, 0x10, 0x00, 0x40, 0x00,
    0x0a, 0x11, 0x04, 0x84, 0x00, 0x20, 0x64, 0x01,
    0x00, 0x20, 0x08, 0x01, 0x00, 0x81, 0x00, 0x07,
    0x00, 0x00, 0x52, 0x52, 0x00, 0x00, 0xff, 0x1f,
    0x00, 0x02,
    "DoD IP test"
};
```

- DECnet frame
1.1->1.3

```
dn_frame[60] = {
    0xAA, 0x00, 0x04, 0x00, 0x02, 0x04,
    0xAA, 0x00, 0x04, 0x00, 0x01, 0x04,
    0x60, /* type field hiby */
    0x03, /* type field loby */
    0x19, 0x00, 0x01, 0x06, 0x00, 0x2A, 0x00,
    0x04, 0x00, 0x03, 0x04, 0x00, 0x00, 0x2A, 0x00,
    0x04, 0x00, 0x01, 0x04, 0x00, 0x00, 0x00, 0x00,
    "WCI, 1989 DECnet test"
};
```

Test Design-23

between vs within

- "between Interface cards" means
input on a port on one interface card
output on a port on a 2nd interface card
- "within Interface card" means
input and output ports are on the same
interface card
- In dual stream case: "between" means
2 input ports on one interface card
2 output ports on 2nd card
- In dual stream case: "within" means
one input and one port on each of
two interface cards, data stream kept
within card

Test Design-22

Test Frames, contd.

- Novell frame
0260.08c2.adb0.00050000->0000.000d.0001.00000002

```
ipx_frame[60] = {
    0x02, 0x00, 0x04, 0x00, 0x02, 0x04,
    0x02, 0x60, 0x8C, 0x2A, 0xDB, 0x0A,
    0x00, /* length field hiby */
    0x26, /* length field loby */
    /* no sscap dsap ctrl */
    /* start IPX PDU ... */
    0xFF, 0xFF, /* milled checksum */
    0x00, 0x26, /* length */
    0x00, 0x11, /* ? */
    0x00, 0x0D, 0x00, 0x01, /* IPX dest */
    0x00, 0x00, 0x00, 0x00,
    0x00, 0x02, 0x40, 0x03,
    0x00, 0x05, 0x00, 0x00, /* IPX src */
    0x02, 0x60, 0x8C, 0x2A, 0xDB, 0x0A, /* MAC src */
    0x04, 0x51, 0x33, 0x33, 0x52, 0x02, 0x00, 0x00,
    0x00, 0x00, 0x59, 0x53, 0x3A, 0x4A, 0x55, 0x4E,
    0x4B, 0x77
};
```

Test Design-24

Test Frames, contd.

```

• AppleTalk II frame
  5.65->107.3

apt2_frame[60] = {
0xA8, 0x00, 0x04, 0x00, 0x02, 0x04,
0x02, 0x60, 0x8C, 0x01, 0x02, 0x39,
0x00,           /* length field hiby */
0x23,           /* length field loby */
0xA8, 0xA8,           /* ssap dsap ctrl */
0x03,
0x88, 0x00, 0x07,           /* snap */
0x80, 0x98,
0x04, 0x18, 0x00, 0x00, /* start APT PDU ... */
0x68, 0x00, 0x05, 0x03, 0x06, 0x7F, 0xPC, 0x03,
0x60, 0x01, 0x02, 0x66, 0x02, 0x00, 0x00, 0x0F,
0x11, 0x7F, 0x00, 0x48, 0x00, 0x00,
0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00,
0x00
};

• bridge test frame
  0000.a333.3333->a00.0333.3333

lb2_frame[60] = {
0xA8, 0x00, 0x03, 0x33, 0x33, 0x33,
0x00, 0x00, 0xA3, 0x33, 0x33, 0x33,

0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00,
0x00, 0x00, 0x00, 0x00, 0x00, 0x00
};

• bridge learning frame
  learn2_frame[60] = {
0x00, 0x00, 0xA3, 0x33, 0x33, 0x33,
0xA8, 0x00, 0x03, 0x33, 0x33, 0x33,
0x07,           /* type field hiby */
0x00,           /* type field loby */
"Wallfleet Communications, 1990 LB learn 8lt=2"
};

```

Test Design-28

Test Results: Routers

How fast is fast?

oops

- this round is of Ethernet to Ethernet local routers
- announcement sent on comp.protocols.tcp-ip
- some vendors missed
- a number of requests for ka9q & pcroute ran out of time

Thanks

- Wellfleet Communications, Inc.
test equipment & software
- Terry Bradley of Wellfleet
software
- Scott Baker of Proteon
much help in debugging procedures
- Dan Lanclani
original test software
future test hardware & software
- BMWG
test design
- Cheryl Chapman
tired fingers

Devices: 3com NETBuilder

- vendor
3Com Corporation
5400 Bayfront Plaza, P.O. Box 58145
Santa Clara, CA 95052-8145
1-800-NET-3Com
- device tested
NETBuilder Brouter - BR/2000
- transport protocols supported
TCP/IP, OSI - CLNP, XNS
- interconnect protocols supported
- bridge mode supported?
Yes
- routing protocols supported
RIP, EGP, RIP-XNS
- interface types supported
serial from 9.6KB to 6MB
Ethernet, 802.3, SNAP
- management protocols supported
SNMP agent, CMOT agent, TELNET server
"remote" facility (UDP datagram access
to the user interface.)

Devices: BBN Communications T/20

- vendor
BBN Communications
US Corporate Headquarters
150 Cambridge Park Drive
Cambridge, MA, 02140
(617) 873-3268
FAX (617) 354-1349
- device tested
T/20 Internet Router
- transport protocols supported
TCP/IP
- interconnect protocols supported
DDN X.25, Blacker X.25, PPP,
BBN-Trunk, HDLC pass-through
- bridge mode supported
no
- routing protocols supported
EGP, BBN-SPF
- interface types supported
serial from 600B - 10Mb
Ethernet/IEEE 802.3, 4MB Token Ring,
16MB Token Ring
- management protocols supported
SNMP agent, HMP agent/poller, TELNET

Device: Network Systems Corp. EN640-8

- vendor
Network Systems Corporation
7600 Boone Av. North
Minneapolis MN 55428
612-424-4888
- device tested
EN640-8
- transport protocols supported
TCP/IP, DECnet Phase IV, OSI (CLNP)
AppleTalk II
- interconnect protocols supported
HDLC
- bridge mode supported
no
- routing protocols supported
RIP, EGP
- interface types supported
serial from 9.6KB to 45MB
Ethernet, 802.3, fddi, mainframe
computer channels (IBM, Cray, Univac,
Honeywell...) computer bus (BI, VME, HPIB,
multibus...)
- management protocols supported
SNMP client, TELNET

Devices: cisco AGS+

- vendor
cisco Systems, Inc.
1525 O'Brien Rd.
Menlo Park, CA 94025
1-800-553-NETS
- device tested
AGS+
- transport protocols supported
TCP/IP, DECnet Phase IV, Phase V,
Novell IPX, XNS, OSI (CLNP), AppleTalk I,
AppleTalk II, Apollo Domain, Banyon Vines
- interconnect protocols supported
HDLC framing, LAPB, X.25, PPP
- bridge mode supported
YES
- routing protocols supported
RIP, EGP, IGRP
- interface types supported
serial from 9.6KB to 4MB
Ethernet, 802.3, 4MB Token Ring, FDDI
- management protocols supported
SNMP client, TELNET

Device: Novell NetWare 386 - TCP/IP

- vendor
Novell, Inc.
2180 Fortune Drive
San Jose, CA 95131
1-408-473-8375
- device tested
NetWare 386 TCP/IP Beta release software
on an AST 486/25E PC
with two Novell NE3200 EISA Ethernet interface boards
- transport protocols supported
TCP/IP, IPX, OSI (CLNP),
AppleTalk I, AppleTalk II
- interconnect protocols supported
- bridge mode supported
no
- routing protocols supported
rip
- interface types supported
Ethernet, 802.3, 4MB Token Ring,
16MB Token Ring, ARCnet, 10 Base T
- management protocols supported
SNMP client, SNMP server

Devices: Proteon P4200

- vendor
Proteon, Inc.
Two Technology Drive
Westboro, MA 01581
(508) 898-2800 ext. 2330
- device tested
p4200 Multi-protocol Internetworking Router
- transport protocols supported
TCP/IP, IPX, DECnet Phase IV, OSI,
AppleTalk I, XNS, Apollo Domain
- Interconnect protocols supported
X.25, IEEE 802.6
- Bridge mode supported
No
- Routing protocols supported
RIP, OSPF, EGP
- Interface types supported
serial from 9.6KB to 2.048MB
Ethernet, 802.3, 4Mb Token-Ring, FDDI
- Management protocols supported
SNMP client, SNMP server, TELNET

Device: Timeplex TIME/LAN 100

- vendor
Timeplex
400 Chestnut Ridge Rd.
Woodcliff Lake, NJ 07675
201-930-4600
- device tested
TIME/LAN 100 Router
- transport protocols supported
TCP/IP
- interconnect protocols supported
X.25
- bridge mode supported
no
- routing protocols supported
GGP, RIP, EGP
- interface types supported
serial from 9.6KB to 1.6MB,
Ethernet, 802.3, FDDI
- management protocols supported
SNMP agent

Device: Proteon XP 20000

- vendor
Proteon, Inc.
Two Technology Drive
Westboro, MA 01581
(508) 898-2800 ext. 2330
- device tested
XP 20000 Multi-protocol Internetworking Router
- Transport protocols supported
TCP/IP, DECnet, IPX, OSI, XNS,
DECnet Phase IV & V, AppleTalk I & II
- Interconnect protocols supported
X.25, Frame Relay
- Bridge mode supported
Yes; spanning-tree, source-routing
- Routing protocols supported
RIP, OSPF, EGP, IS-IS
- Interface types supported
serial from 9.6KB to 2048MB, Ethernet, 802.3,
4Mb Token-Ring, 16Mb Token-Ring, FDDI
- Management protocols supported
SNMP client, SNMP server, TELNET

Device: Wellfleet Link Node

- vendor
Wellfleet Communications Inc
15 Crosby Drive,
Bedford, MA 01730
617-275-2400
- device tested
Link Node Communications Server
- network protocols supported
TCP/IP, DECnet, XNS, Novell IPX, AppleTalk II
- interconnect protocols supported
X.25, Frame Relay, LLC1 point to point,
LLC2 point to point
- bridge mode supported?
Yes
- routing protocols supported
Extended RIP, EGP, OSPF
- interfaces supported
serial from 9.6KB to 6MB,
Ethernet, 802.3, 4 MB Token Ring,
16 MB Token Ring, FDDI, 10BaseT
- management protocols supported
TELNET, SNMP Client,
SNMP server, EMA

Perspective

- 6 M frame per second router on a 9.6KB link not all that useful
- theoretical frame rates for link speeds
64 octet frames
"ideal" serial links, i.e. no MAC address rounded up

link speed	fps
2.4KB	5
9.6KB	19
56KB	110
64KB	125
.5T1	1508
T1	3016
Ethernet	14,880
T3	>85,000
FDDI	>175,000

Throughput

- getting faster
3 "wire speed" routers
(for some frame sizes)
- impressive performance from PC
- cluster of mid range devices
much like new bridges
~6K FPS

Delay

- in all but one case
max delay < 1ms
variability < .5ms
- one case
even distribution from .2 to 10ms
looks like software loop

protocols

- good range of protocols supported
- most devices were a bit slower in non-ip case
- bridge mode quite good
less need to use two devices

Multi stream

- hard to do good multi-stream test, hard to see actual peak rates

Proteon XP 20000
combined rate of about 16K FPS
with full speed input

about 20K if inputs slowed to ~10K FPS each

- may be useful, better test needed

ests

- fastest: (alpha order)
BBN, cisco, Wolffleet
- best pkg:
3com
- most like a mainframe:
NSC
- most surprising:
Novell
- suggest (& most compact):
Timeplex
- most promising development:
Proteon XP 20000

Back to back

- good test of queue size
- software bug in tester prevented testing

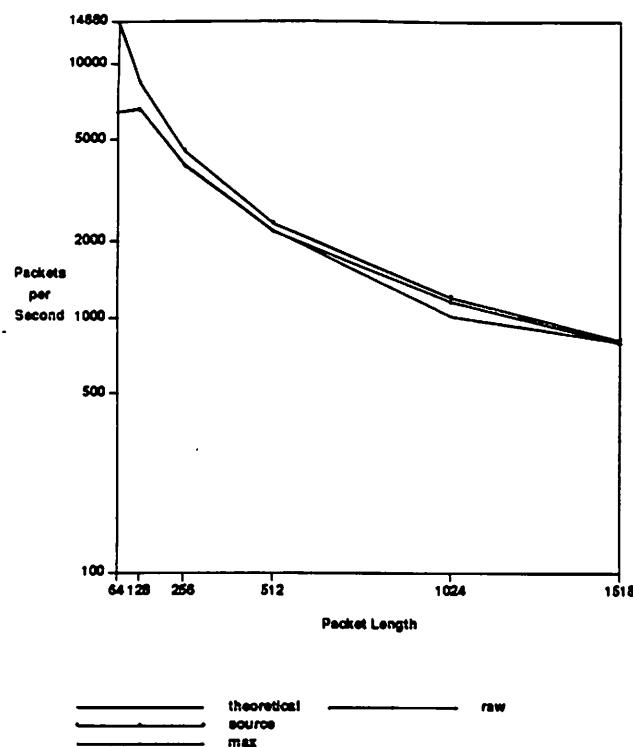

Software versions

- versions of system software used in the tests

3com
1.1
BBN
1.0
cisco
8.20
Novell
1B3
NSC
(oops)
Proteon
p4200 - 9.1x
XP 20000 - 9.1x
Timeplex
1.X7
Wolffleet
5.40
